Important information for harvesting wild American ginseng in the State of Minnesota

- No license is required to harvest wild ginseng on private land in Minnesota.
- A Minnesota dealer’s license is required to buy wild ginseng from harvesters; sell wild ginseng to an unlicensed dealer or to a processor, broker, wholesaler, or retailer; or carry, ship or export wild ginseng out of the state.
- The harvest season for wild ginseng in Minnesota is September 1 to December 31.
- State law requires all harvested plants to have at least 3 prongs with 5 leaflets on each.
- Minnesota requires that seeds of collected wild ginseng plants be planted in the area where the plants were dug immediately after harvest. The law specifies that seeds “must be planted by removing surface litter, planting each seed at a depth of one-half inch in the underlying soil, and replacing the surface litter over the planting site.”
- Ginseng may not be harvested in any Minnesota State Park or other area under the administration of the state’s Division of Parks and Recreation. Harvest is allowed in state-owned wildlife management areas with a proper permit from a state wildlife manager.
- The Minnesota Department of Natural Resources, Natural Heritage Program, Section of Wildlife, serves as the state’s ginseng coordinator. This office can be reached at (651) 259-5142 or:
  500 Lafayette Road
  St. Paul, MN 55155
- A permit is required to collect ginseng in Chippewa or Superior National Forests. These can be contacted at (218) 335-8600 or (218) 626-4300, respectively.

The harvest practices presented in this brochure are provided to encourage people who collect wild American ginseng to act as stewards of the plant and of its habitat. By following these guidelines, you are contributing to and protecting a sustainable future for wild American ginseng, and preserving a longstanding American tradition.

GOOD STEWARDSHIP HARVESTING OF WILD AMERICAN GINSENG (Panax quinquefolius)

American ginseng is a long-lived perennial plant that grows in woodlands throughout the mountain areas of the Eastern United States and Canada. Plants come up in early spring, produce small greenish-yellow flowers and green fruit in mid-summer, which mature to bright red. Plants die back in the fall.

American ginseng roots have been traded continuously in international commerce since the beginning of the 18th Century. The biggest market has always been in Asian countries, which buy more than 30 tons of wild American ginseng every year.

American ginseng has been protected since 1975 under an international treaty known as CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora), which requires its export to be regulated by the U.S. Fish & Wildlife Service (FWS). FWS must ensure that exported wild ginseng is harvested in a manner that is both legal and not detrimental to the survival of the species. For specific export requirements see:
http://www.fws.gov/international/animals/ginindx.html

Stewardship Harvesting of Wild American Ginseng

There are a number of harvest practices that must be followed for a collector to be a ginseng steward:

GET PERMISSION TO HARVEST
Whether you are on private or public land, always get permission before digging ginseng. Some National Forests and state-owned lands will allow harvest of ginseng but require you to obtain a permit. Harvest is not allowed in any National Park.

When digging on public land, always obtain required permits and comply with all rules. When digging on private property, get the permission of the landowner or his/her agent. Also, report any signs of property damage, habitat loss, or trespassing to the landowner.

RESPECT AMERICAN GINSENG’S LIFE CYCLE
American ginseng’s life cycle, as shown, illustrates the life stages of the plant. Seedlings have only 1 prong (leaf), which usually has 3 leaflets. The next phase has 2 prongs, with 3 or 5 leaflets on each. Mature plants have 3 or 4 prongs, each with 5 leaflets.

Researchers have estimated that each ginseng plant in the wild needs to produce over 30 seeds to replace each plant harvested. Never harvest seedling (1-prong) or juvenile (2-prong) plants, or plants that are less than 5 years old with at least 4 “bud scars” on the “neck” at the top of the root. Roots from younger plants are not allowed to be exported and many ginseng buyers won’t buy these small roots, so it’s best to leave these plants in the ground for future harvests.

DIG SOME, LEAVE SOME
Good stewardship requires diggers to leave enough plants so that populations continue to be healthy and plentiful. Always leave some mature plants in every ginseng patch where you dig.

HARVEST ONLY IN THE HARVEST SEASON
The harvest season for wild ginseng varies by state. Make sure you know the legal state harvest season where you dig ginseng, and always comply with the state rules.

Never harvest plants before the fruit is ripe (red). This is a requirement in most states, and is an essential good stewardship practice.

PLANT RIPE FRUIT!!!
Experienced harvesters know to plant ginseng’s red berries as they dig the roots. This stewardship practice may explain why ginseng is still in the woods after three centuries of digging.

The best practice is to plant the red berries under ¾ to 1 inch of soil. Researchers have found that planting the ripe seeds at this depth can produce up to 8 times more seedlings!

PROTECT AMERICAN GINSENG’S HABITAT
Stewards of wild ginseng must care for the plant, as well as its native habitat.

Be aware of land-use and zoning activities in your community and join with local organizations to make your voice heard. Though landowners’ property rights should be respected, make sure they are aware of the value of ginseng and other non-timber plants on their land.

OTHER STEWARDSHIP PRACTICES
Every ginseng steward should be aware of a few other practices:
• After you dig some of the mature plants in a ginseng patch, and have planted all of the red ripe seeds, break the stems off of any remaining plants so that others don’t take more plants from the same population.
• Think about planting your own woodland ginseng patch with local native seeds so that even more ginseng is produced for the future.
